AurumScalp

UI / UX SPECIFICATION · V1

Gold Scalping Bot SaaS Web Dashboard

Every screen for the customer app, the public site and the admin console: login, onboarding, live dashboard, EA and risk control, analytics, billing, mobile and system states.

Dark theme first | Next.js + Tailwind | WCAG AA contrast

Prepared for Umair Noor · 29 Sep 2026 · "AurumScalp" is a placeholder brand name. All numbers on screens are sample data.

Design system

Tokens, type and components every screen is built from

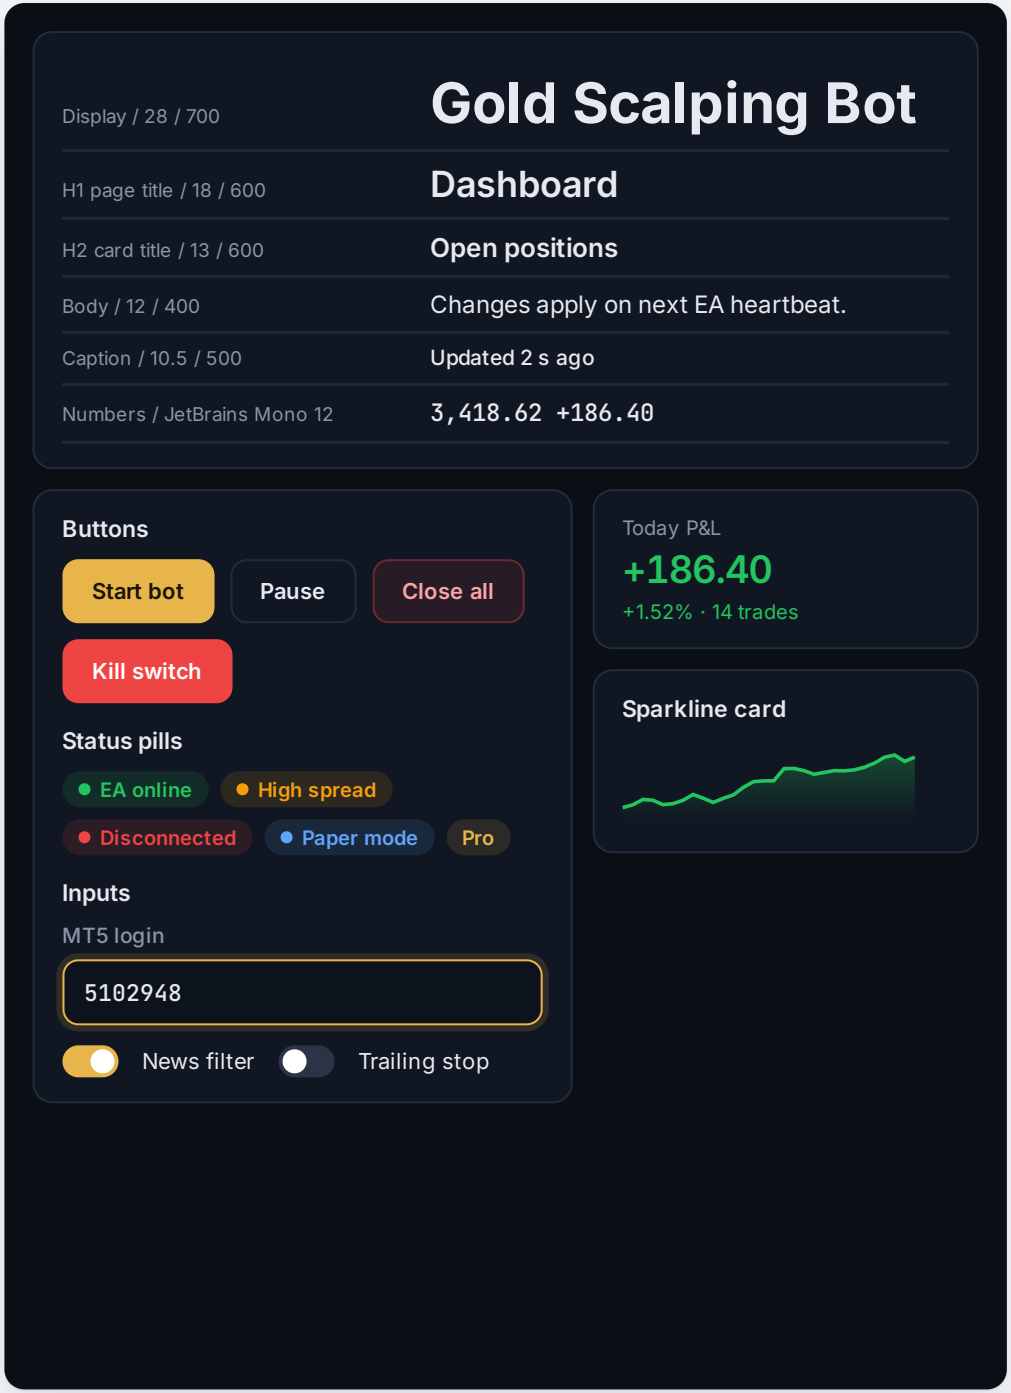

COLOUR TOKENS

Background	Surface	Surface 2	Border	Text	Muted
#0A0E15	#111722	#161E2B	#222C3B	#E6EAF0	#8A95A8

Gold / primary	Profit	Loss / danger	Warning	Info
#E7B54A	#22C55E	#EF4444	#F59E0B	#60A5FA

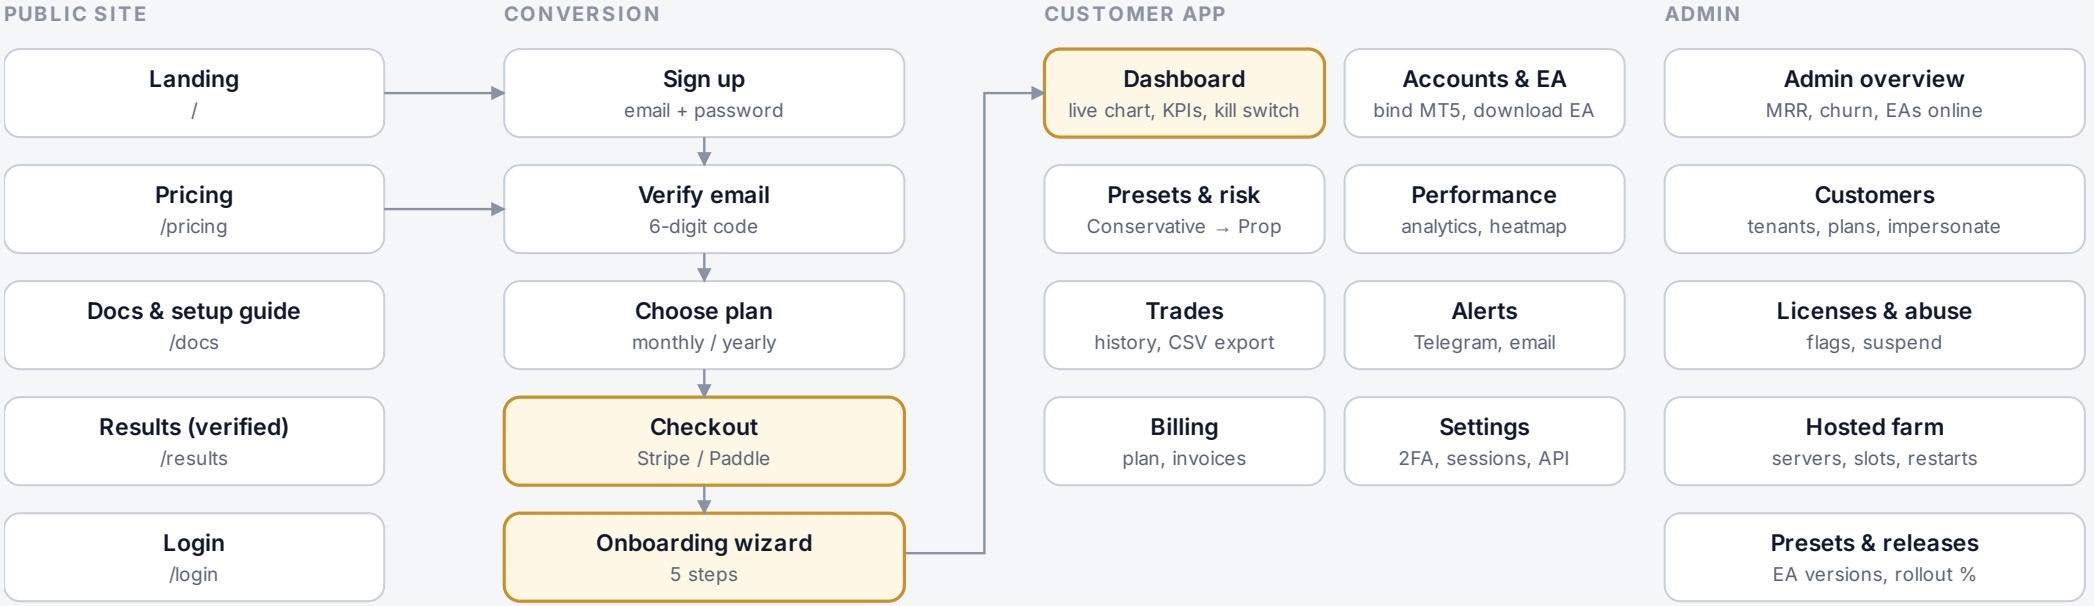

RULES

- Green and red are reserved for P&L and buy/sell. Never for decoration.
- Gold is the single brand accent: primary buttons, active nav, selected preset.
- Every coloured status also carries a word or icon (colour-blind safe).
- All prices and money use tabular or mono digits so columns line up.
- 8 px spacing grid, 10 px card radius, 1 px borders, no heavy shadows.
- Light theme = same tokens inverted; ship dark first (traders expect it).

Sitemap & user flows

Every screen and how customers move from visitor to live trading

Happy path to first trade (target < 10 min)

1. Pricing → Start trial → sign up → verify email
2. Checkout (trial: demo accounts only) → license issued
3. Download EA → attach to XAUUSD chart → paste license key
4. Handshake green → pick preset → first trade alert on Telegram

returning user: login → 2FA → dashboard

One job per screen

Each page answers one question: Is my bot OK? How is it doing? What did it trade? What do I pay?

Short conversion path

Four steps from pricing to a connected EA. Trial runs on demo accounts only, so nobody risks money before paying.

Admin is separate

Admin lives at /admin with its own role check and 2FA required; every action goes to the audit log.

Deep links

Alert messages link straight to the trade or account they are about.

Landing page

Public home page: explain, prove, convert

aurumscalp.com

A AurumScalp Product Results Pricing Docs Log in Start 7-day trial

XAUUSD scalping · MT5

Precision gold scalping, running on your own MT5.

Tick-level entries with spread, session and news filters. Your account, your broker, your risk limits. Control everything from one dashboard.

Start free trial See verified results

Trial runs on demo accounts. Trading involves risk of loss; past results do not guarantee future results.

Tracked live accounts	Avg slippage	Profit factor (12 mo)	Max drawdown (12 mo)
212	0.4 pts	1.48	9.6%
sample data	from execution logs	all presets, after costs	Balanced preset

01 Subscribe
Pick a plan, start a demo-only trial.

02 Install the EA
Drop it on an XAUUSD chart, paste your license key.

03 Choose a preset
Conservative to Prop-Firm. Change risk any time.

Proof over promises
Stats come from tracked execution_stats, labelled with period and preset. No screenshot P&L, no return promises.

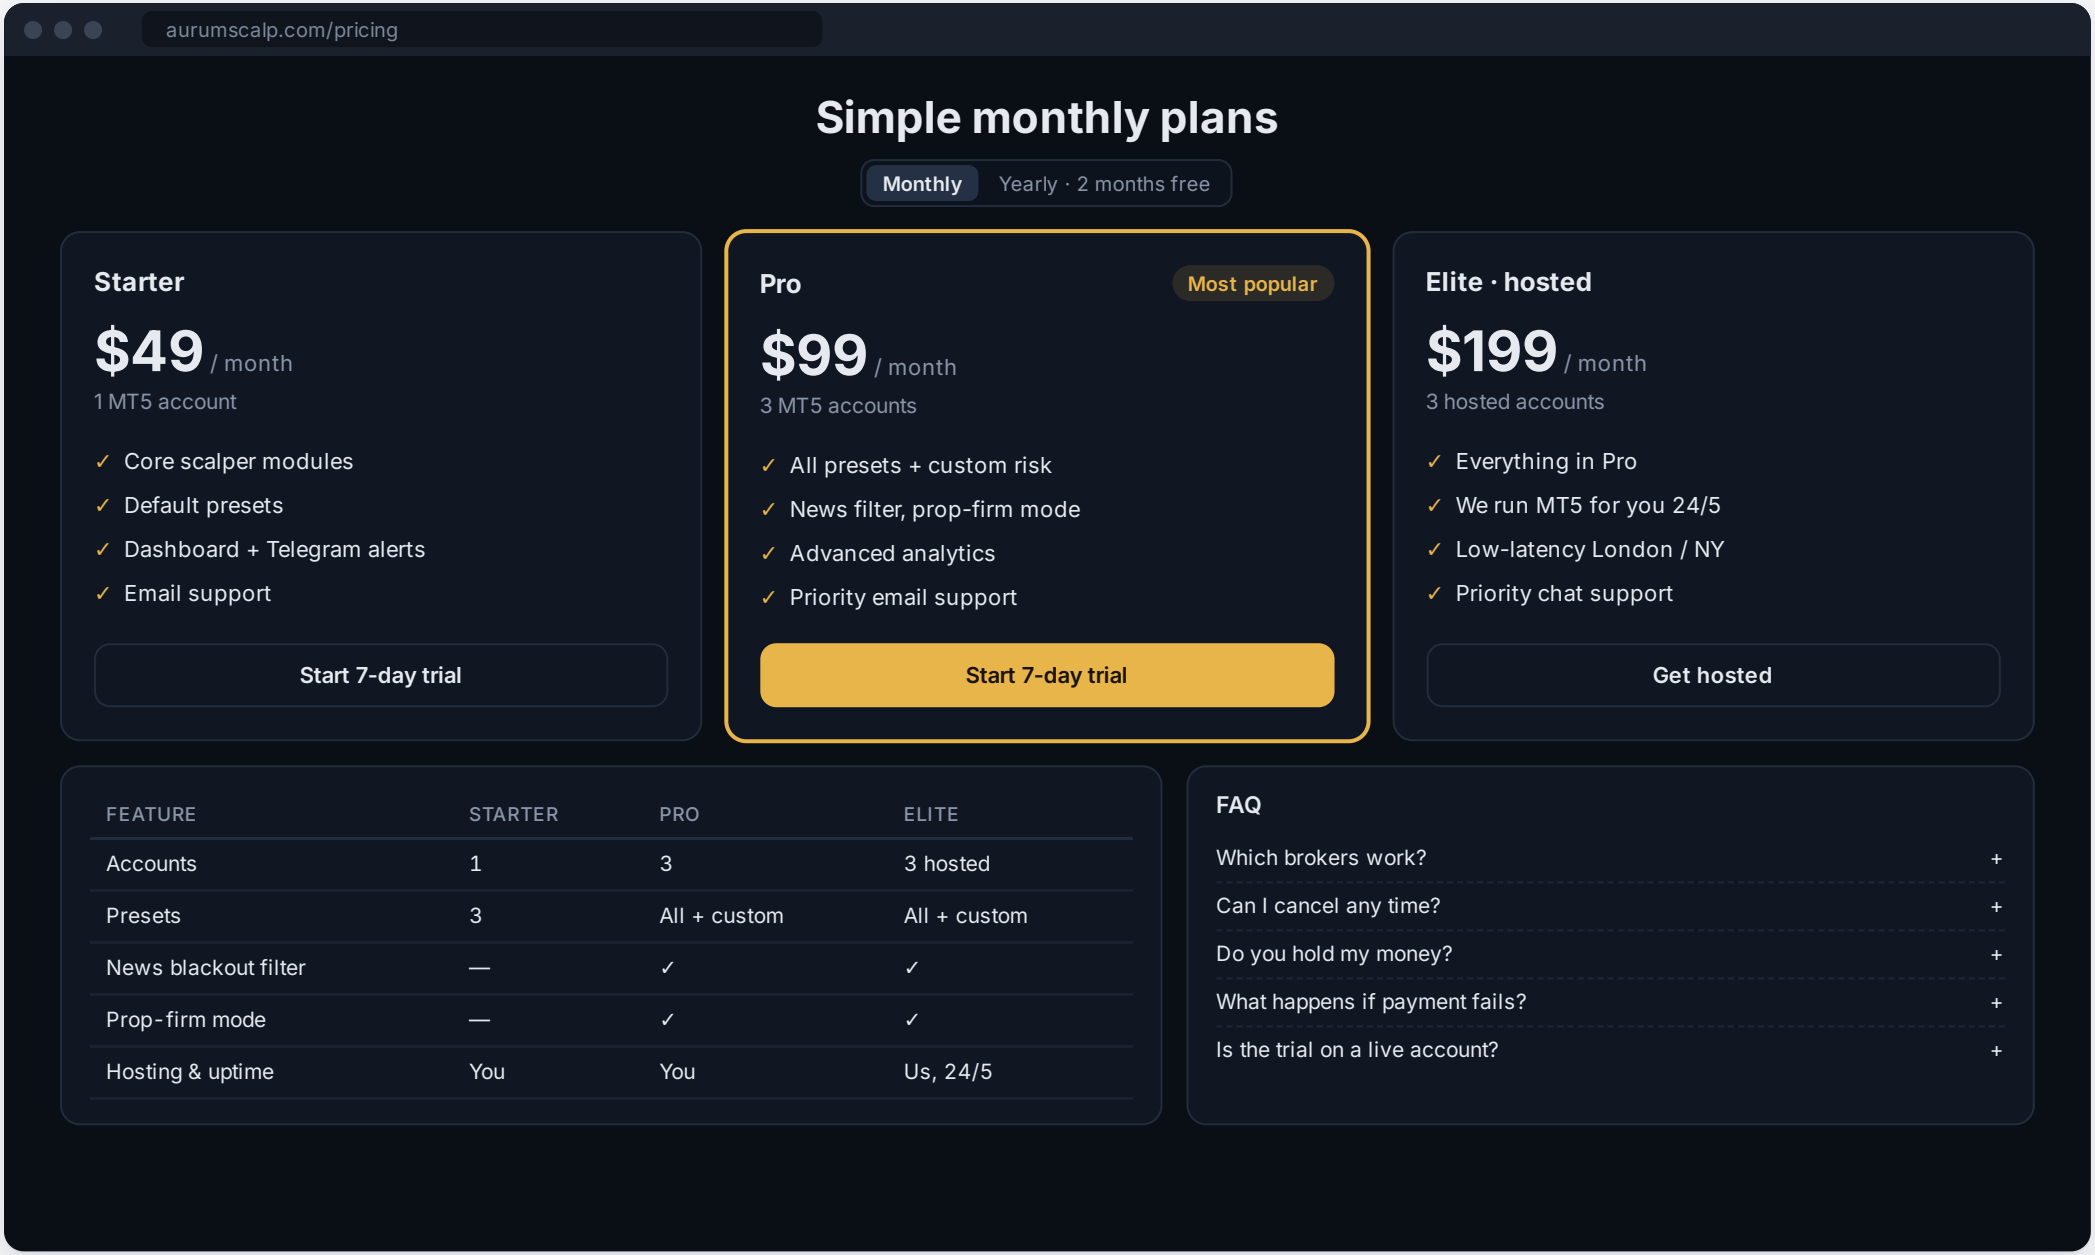

Risk disclaimer
Visible in the hero and footer, not hidden in terms. Protects trust and payment-provider approval.

Primary CTA
One gold button: Start free trial. Secondary: See verified results.

Performance
Static page, under 1.5 s load; chart is a live demo account feed.

Pricing

Three tiers, one highlighted; monthly/yearly toggle

Anchor on Pro
Middle plan highlighted with gold border; it is the one most customers should pick.

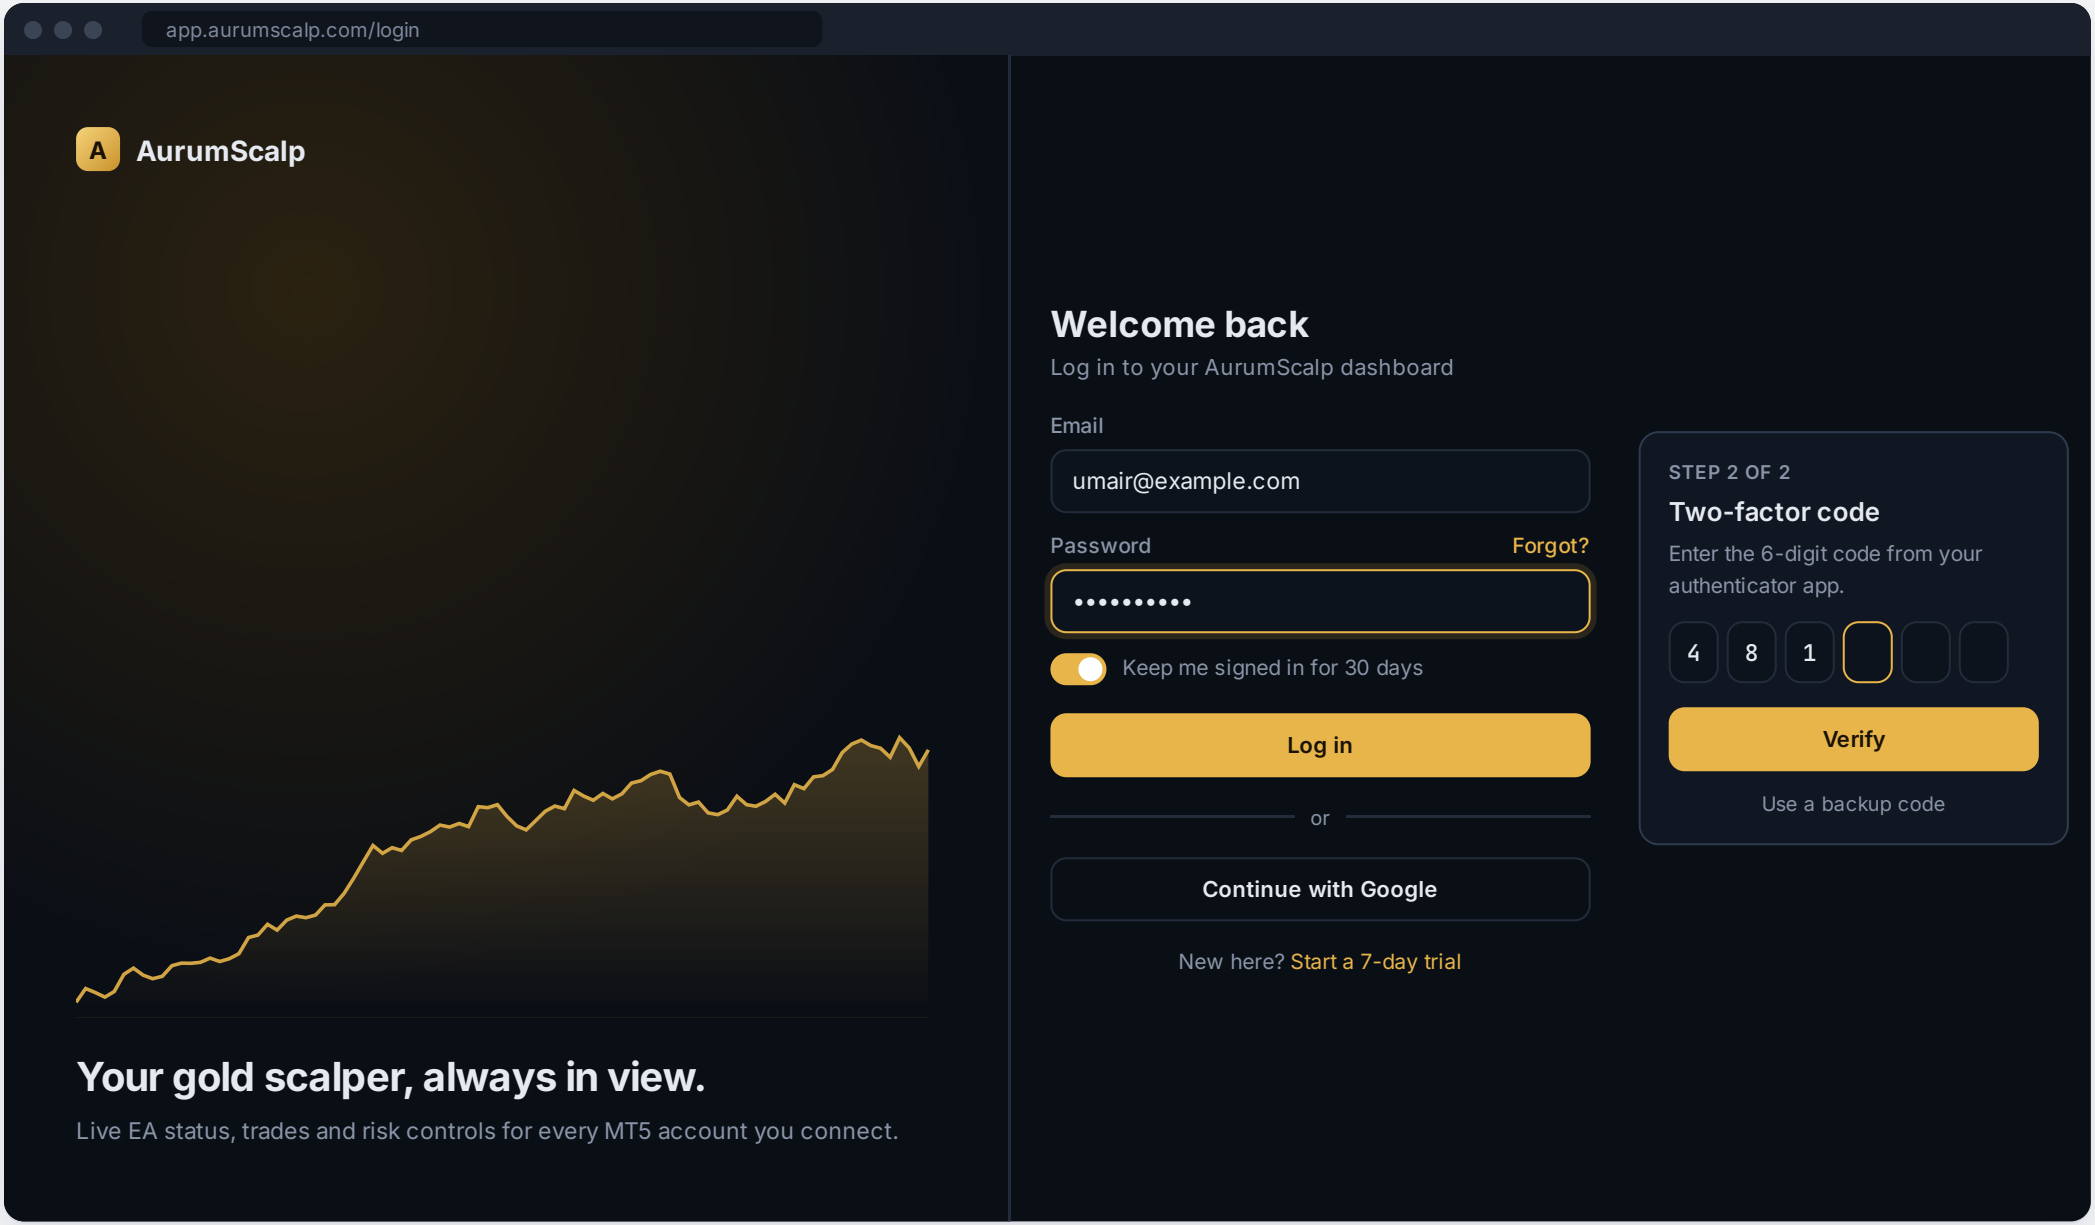

Honest limits
Account limits shown on every card; the license enforces exactly what is shown here.

Yearly toggle
Switches all prices in place; no page reload; shows effective monthly price.

FAQ answers objections
Money custody, cancellation and failed payments are the top pre-sale questions.

Login & two-factor

Split layout; 2FA step shown beside the form

Low friction, high security

Email + password or Google; 2FA (TOTP) prompted when enabled, required for admins and hosted Elite accounts.

Clear errors

Wrong password: one generic message (no hint whether the email exists). 5 failures → 15-minute lock + email.

Code input

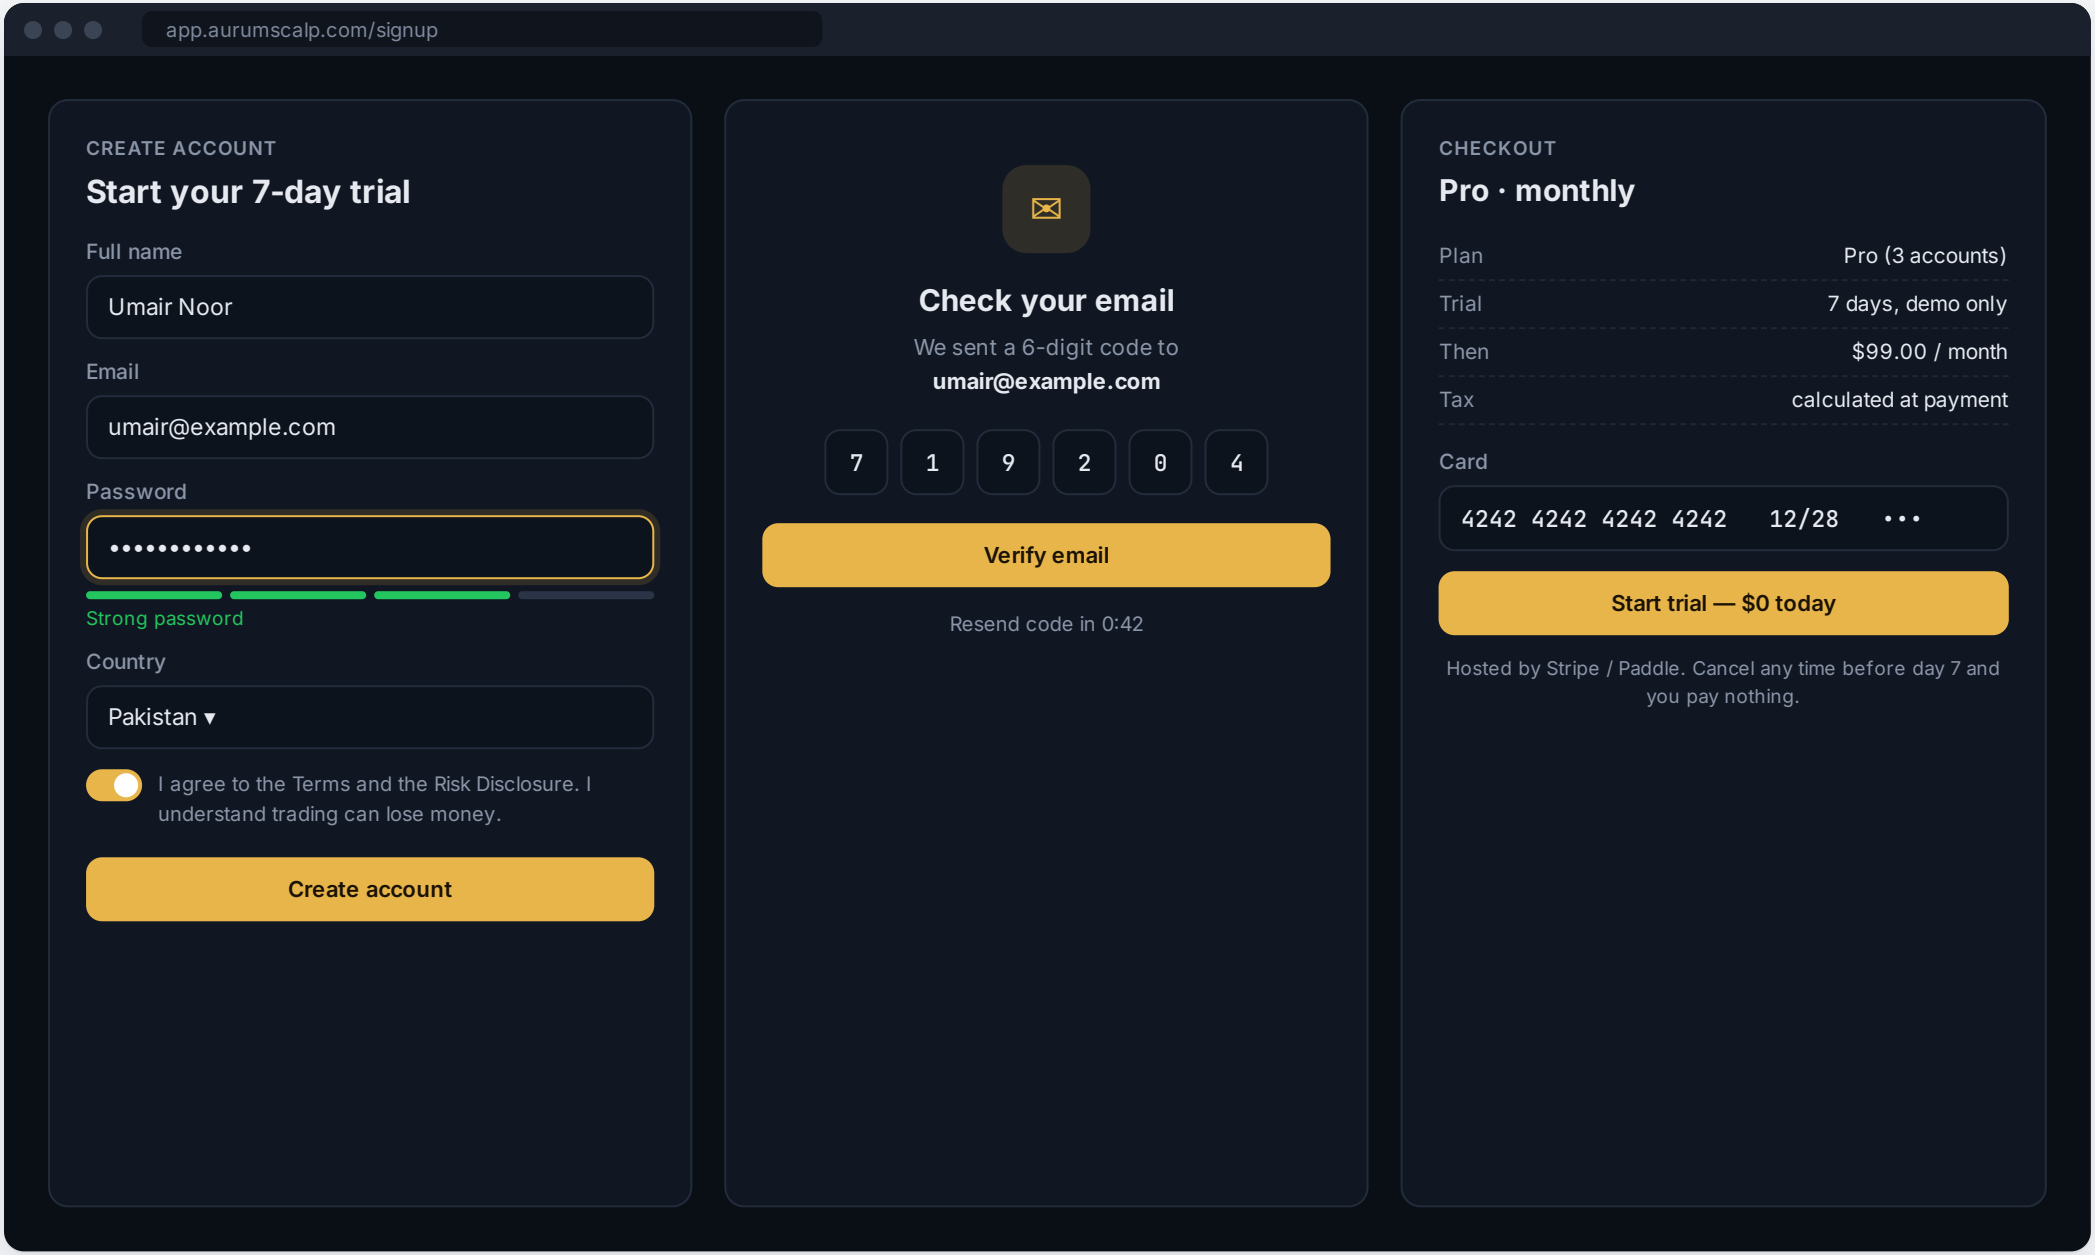

6 boxes, auto-advance, paste fills all, numeric keyboard on mobile.

Session

30-day remember-me uses a rotating refresh token; the Security page lists and revokes sessions.

Sign up, verify & checkout

Three steps from visitor to trialing customer

Risk consent

Explicit checkbox for Terms + Risk Disclosure; stored with timestamp and IP in audit_log.

Verify before pay

Email code confirms a real inbox before checkout, cutting fake trials and chargebacks.

Hosted checkout

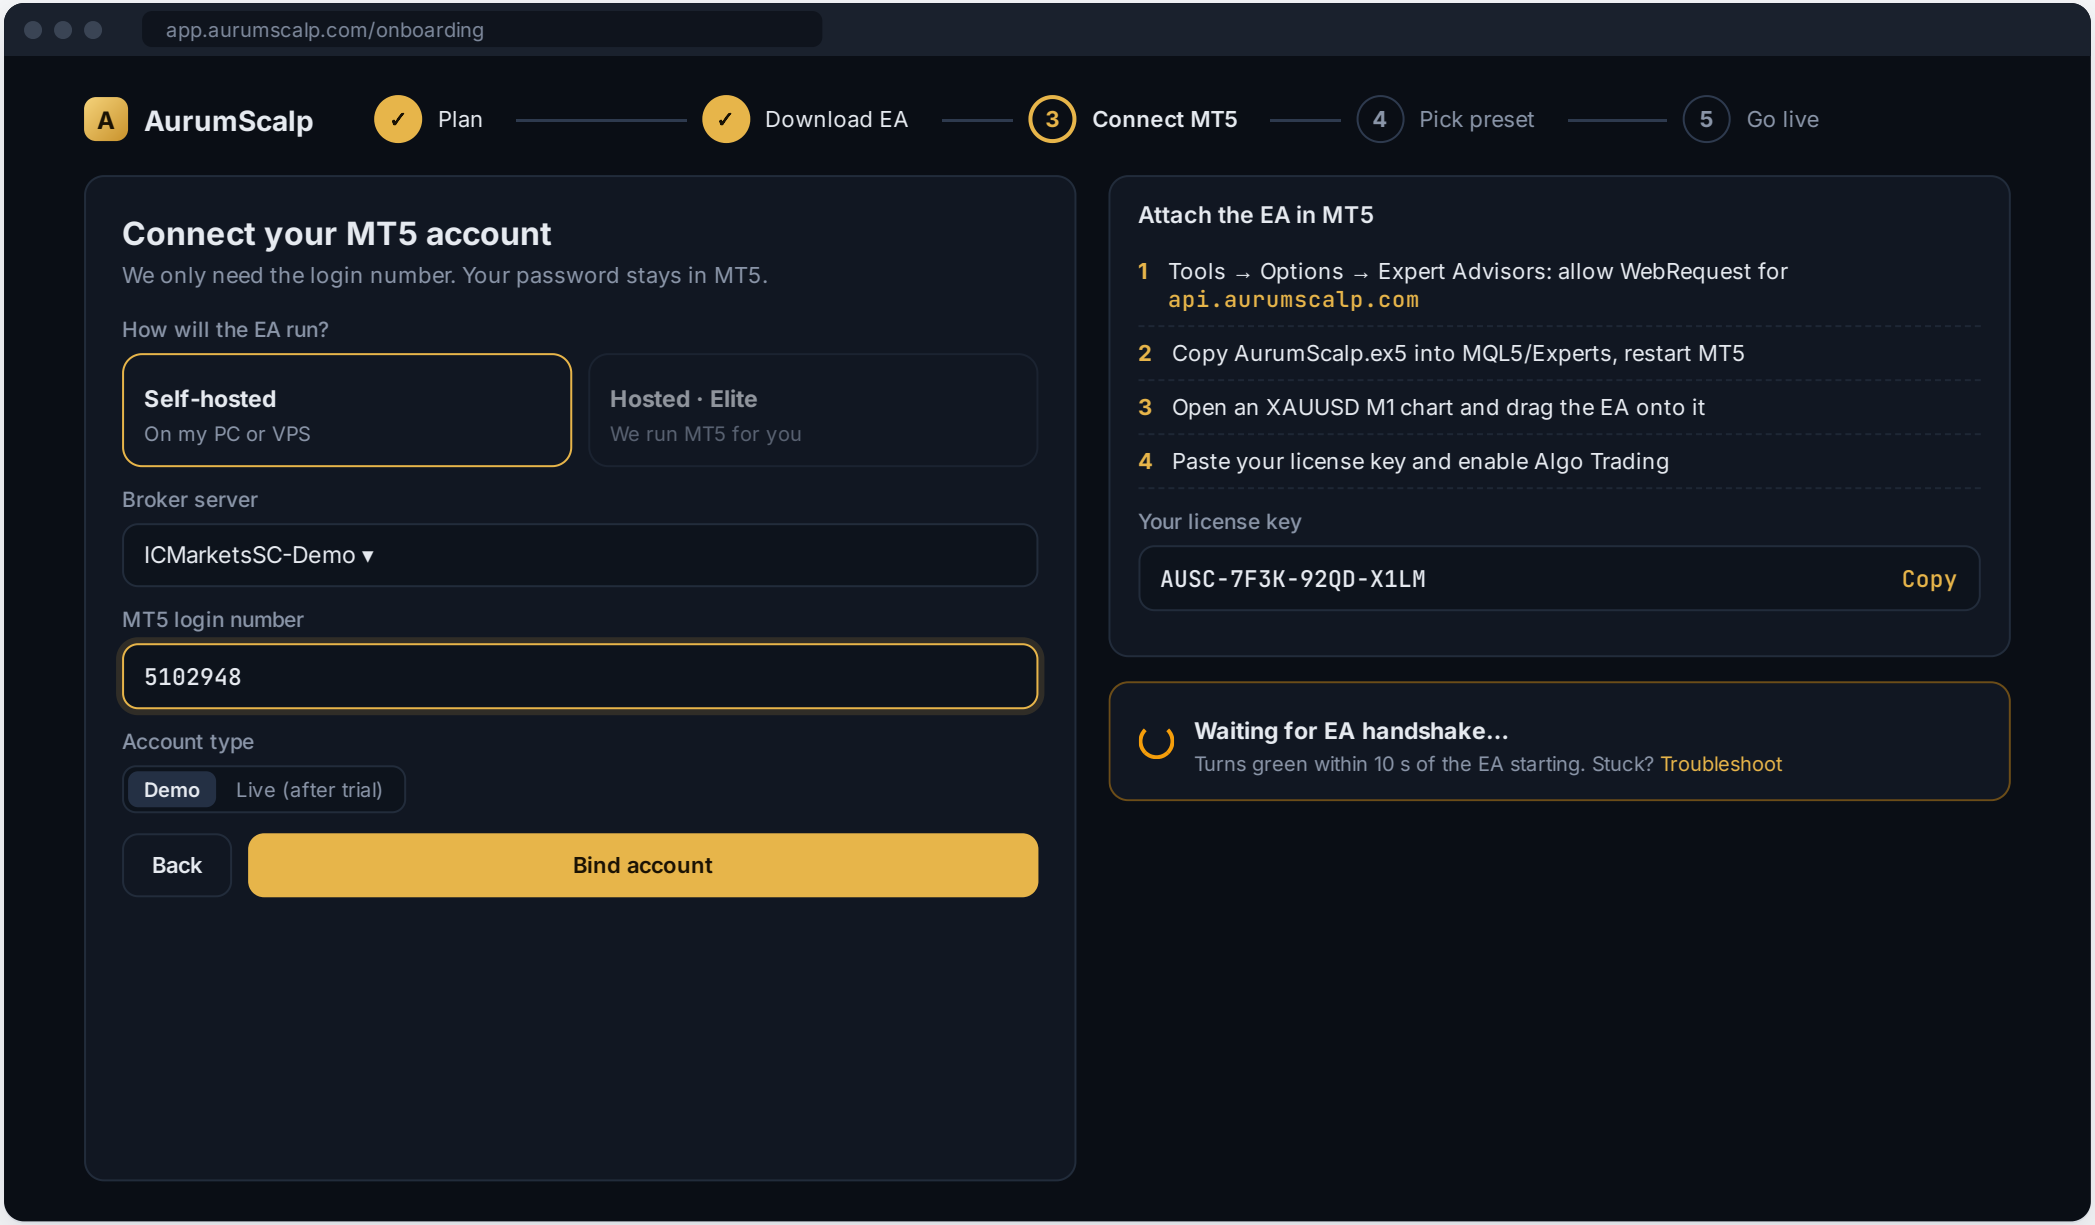

Card details never touch our servers; provider page styled to match (logo, gold button).

Trial rule

Trial licenses only bind demo MT5 accounts; live accounts unlock after first payment.

Onboarding wizard

Step 3 of 5 shown: bind MT5 and confirm the EA handshake

Progress always visible

5-step stepper; completed steps are clickable to go back; progress saved if the user leaves.

Live confirmation

The wizard polls the handshake; the moment the EA connects, the card turns green and Next unlocks.

Self-serve help

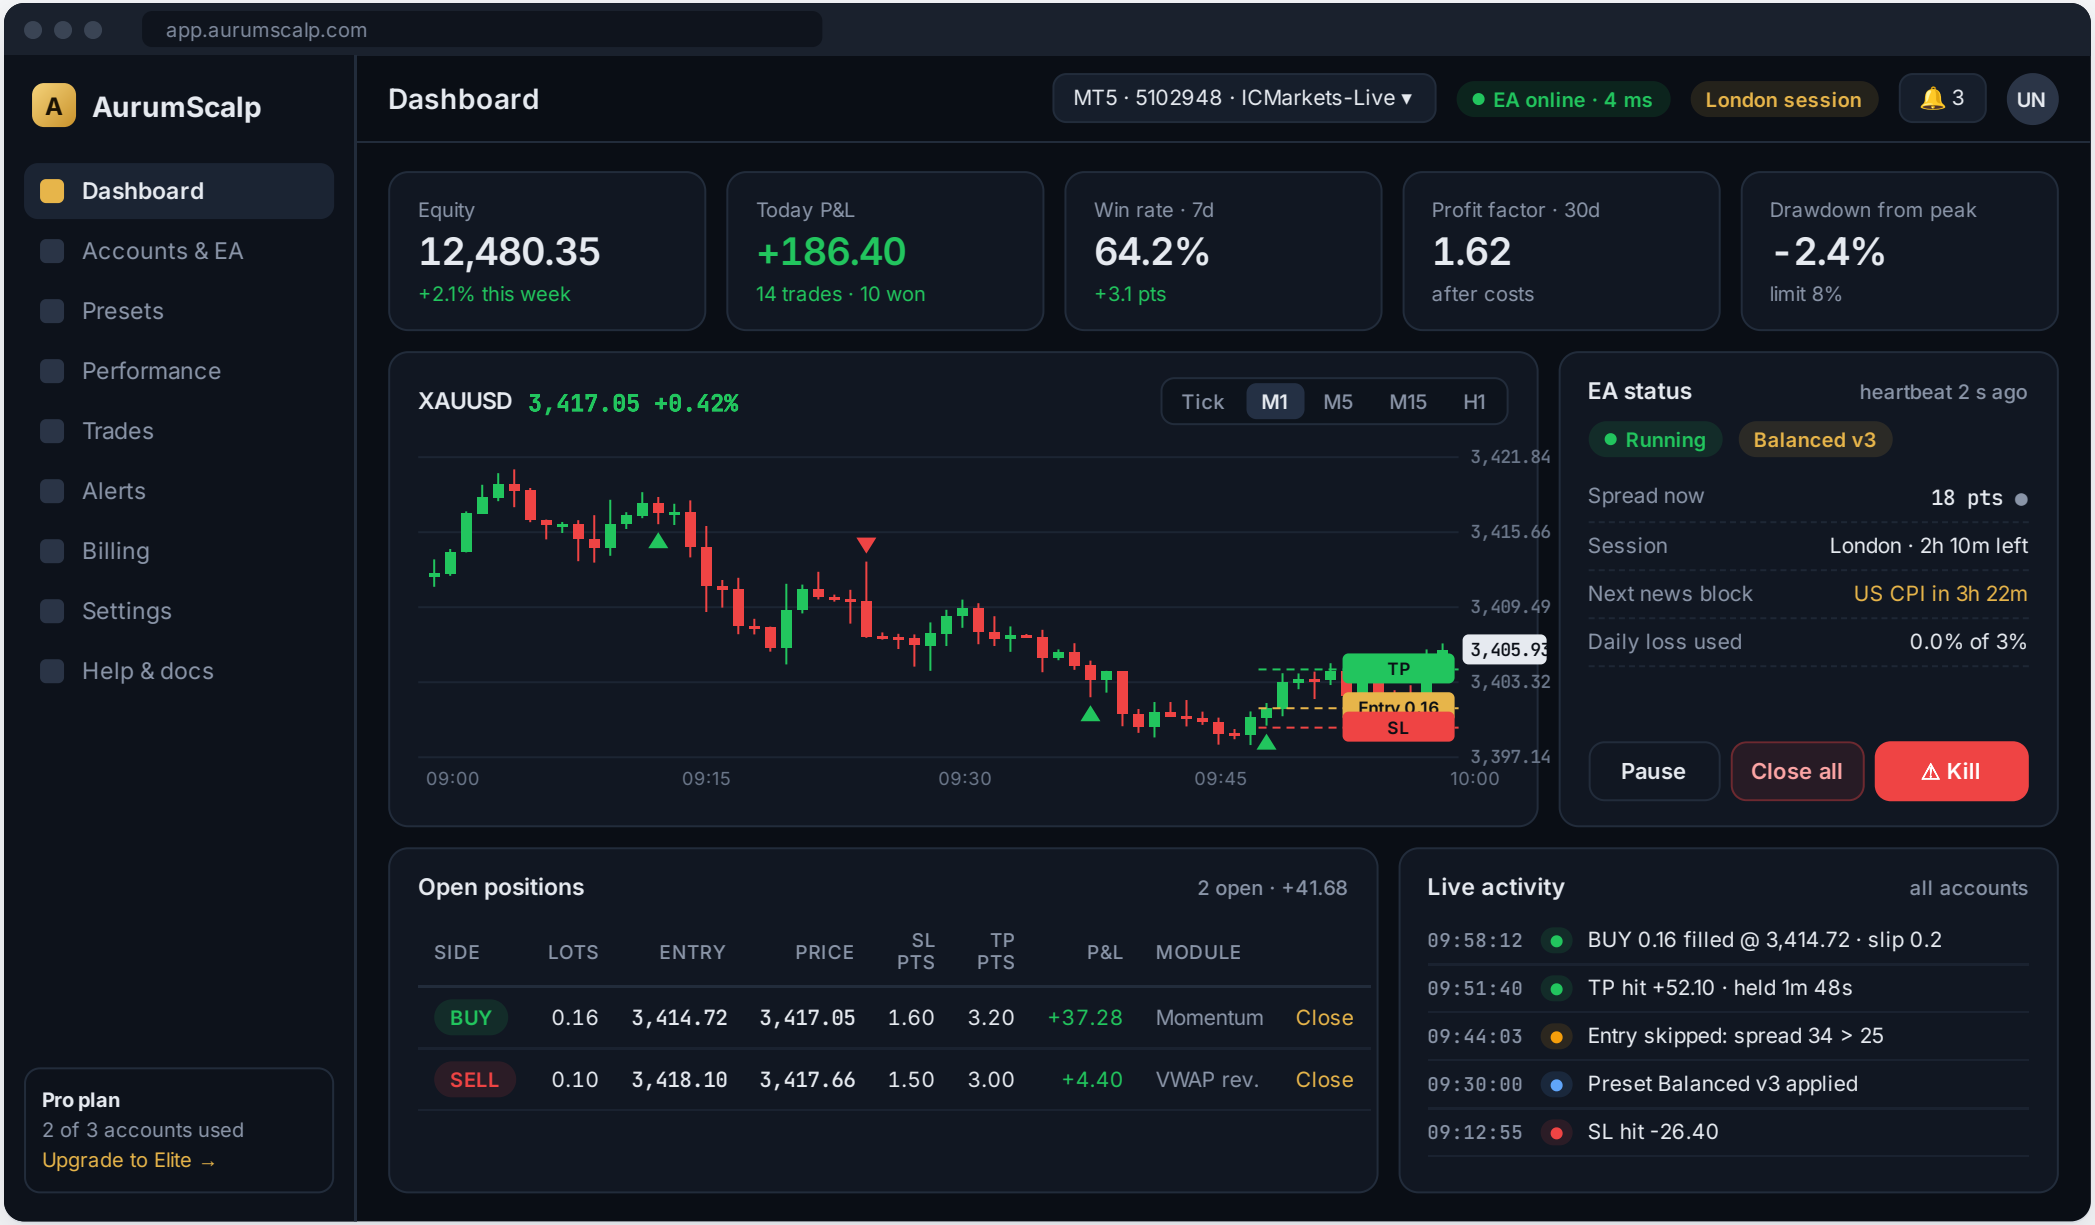

Troubleshoot opens a checklist: WebRequest URL, Algo Trading button, wrong symbol suffix, market closed.

Target

Median time from checkout to first handshake under 10 minutes; track it as a product metric.

Main dashboard

The home screen: is my bot healthy, what is it doing, how is it performing

Glanceable health

Top bar pill and EA card answer 'is it OK?' in one second: green running, amber paused/high spread, red disconnected.

Chart = truth

Entries, exits, SL/TP lines drawn on the live chart so customers see why each trade happened.

Safety within reach

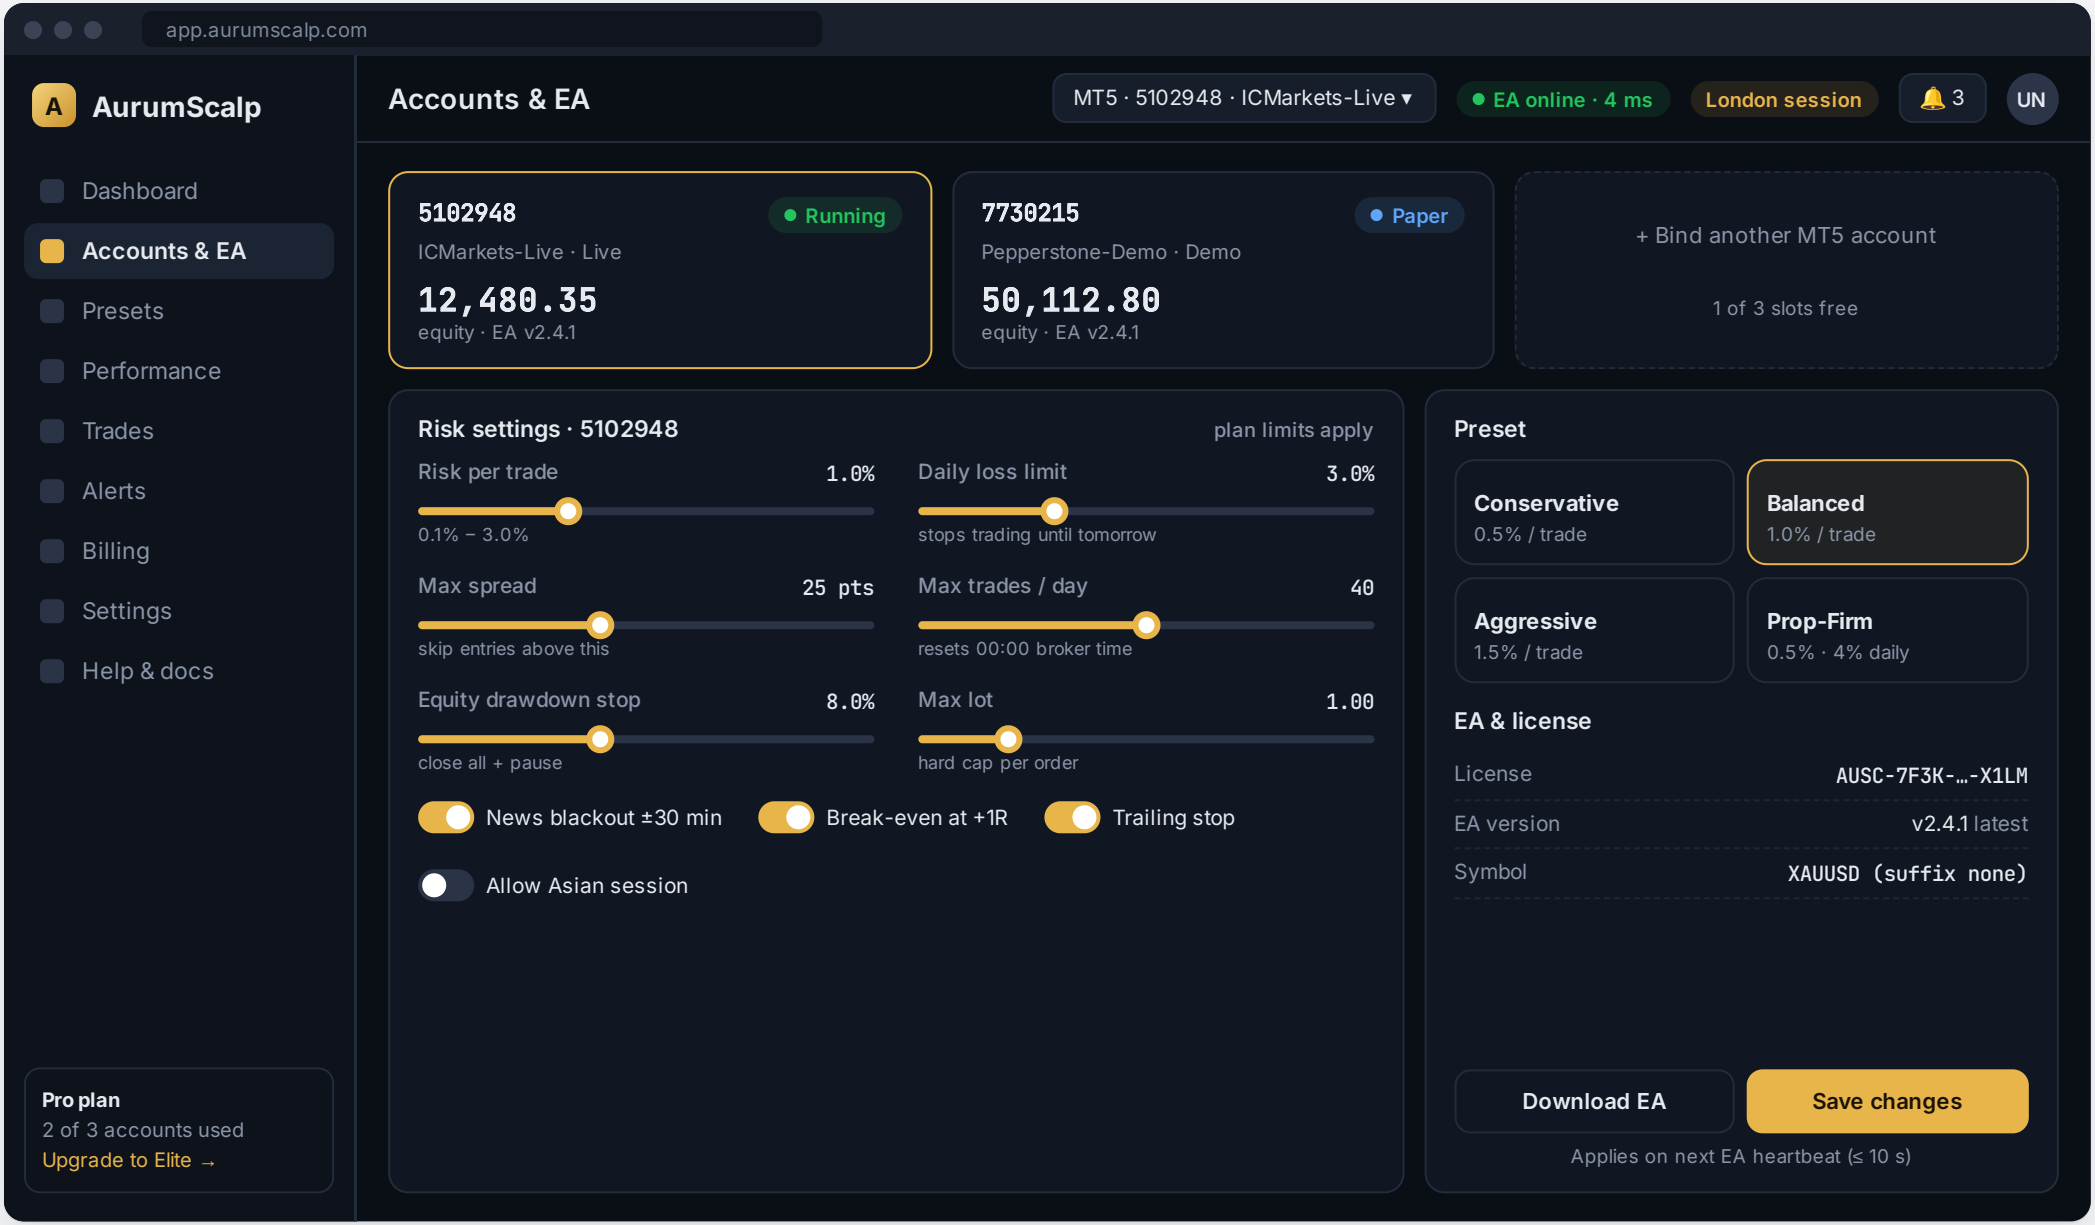

Pause, Close all and Kill switch on the home screen; kill switch asks for confirmation (see States page).

Real-time

WebSocket updates price 4×/s, P&L 1×/s; a 'last update' stamp turns amber if data is stale over 5 s.

Accounts, EA & risk controls

Bind MT5 accounts, pick a preset, set hard risk limits

Account cards

One card per bound MT5 login with status and equity; empty dashed slot shows how many the plan still allows.

Presets first

Most users pick a preset and stop; sliders are for Pro users who want control.

Guard-rails

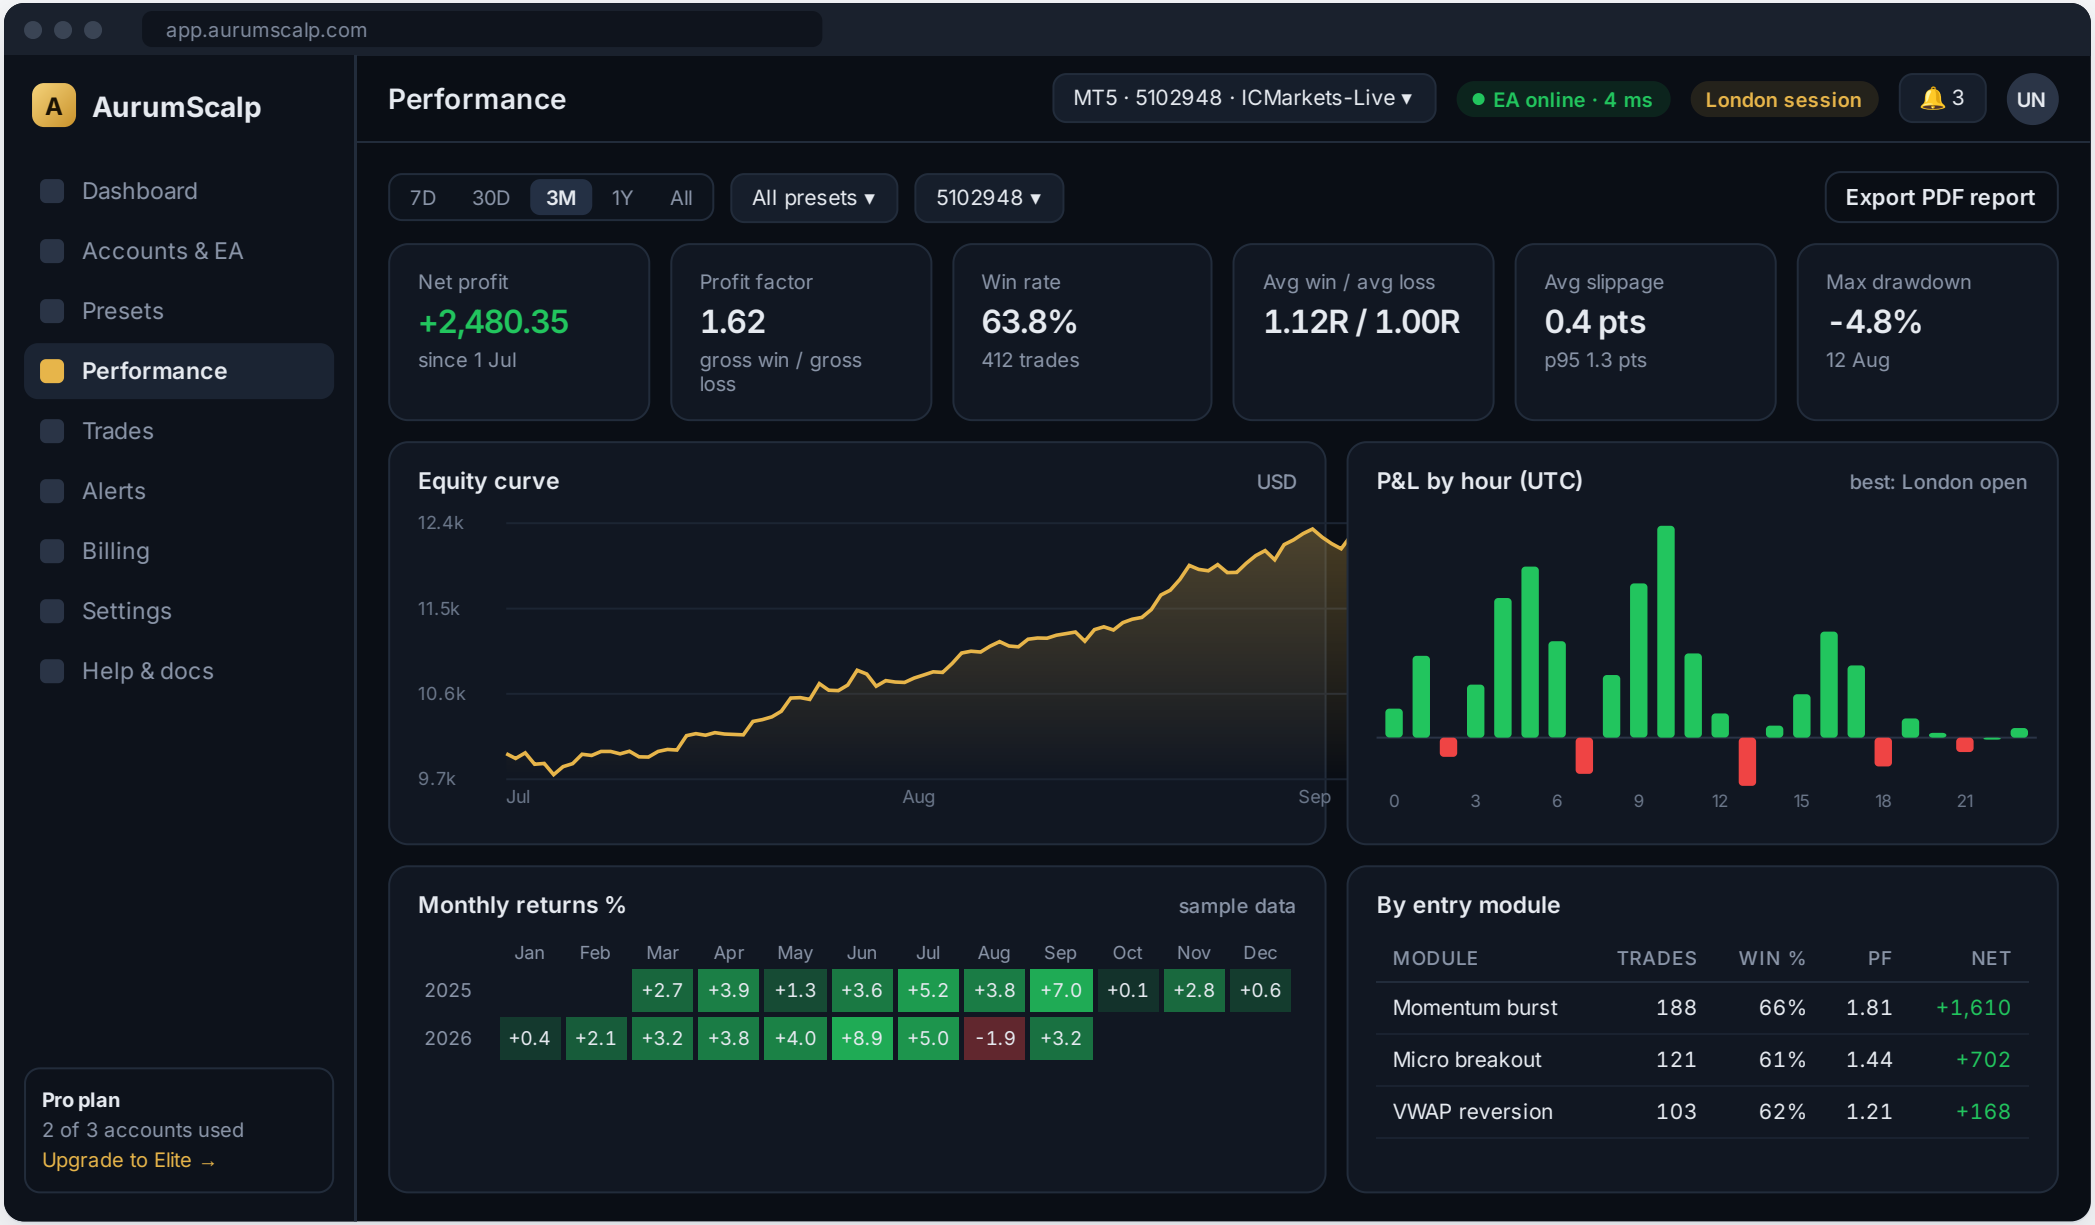

Slider ranges come from the plan and server; the API rejects out-of-range values too.

Change feedback

Save shows 'Pending' until the EA confirms the new config on its next heartbeat, then 'Applied'.

Performance analytics

Proof the strategy works, and where it works best

Honest metrics

Profit factor, drawdown and slippage sit next to profit; nothing is shown without its cost.

Find the edge

P&L by hour and by module tell users (and you) when the scalper earns and when to switch it off.

Same filters everywhere

Period, preset and account filters persist across Performance and Trades via the URL.

Shareable report

Export PDF produces a branded monthly statement; customers share it, which markets the product.

Trade history

Every closed trade with its execution quality

Showing 1–13 of 412 ‹ 1 2 3 … 32 ›

Execution columns
Slippage, spread at entry and hold time are unique to scalping; they explain why live differs from backtest.

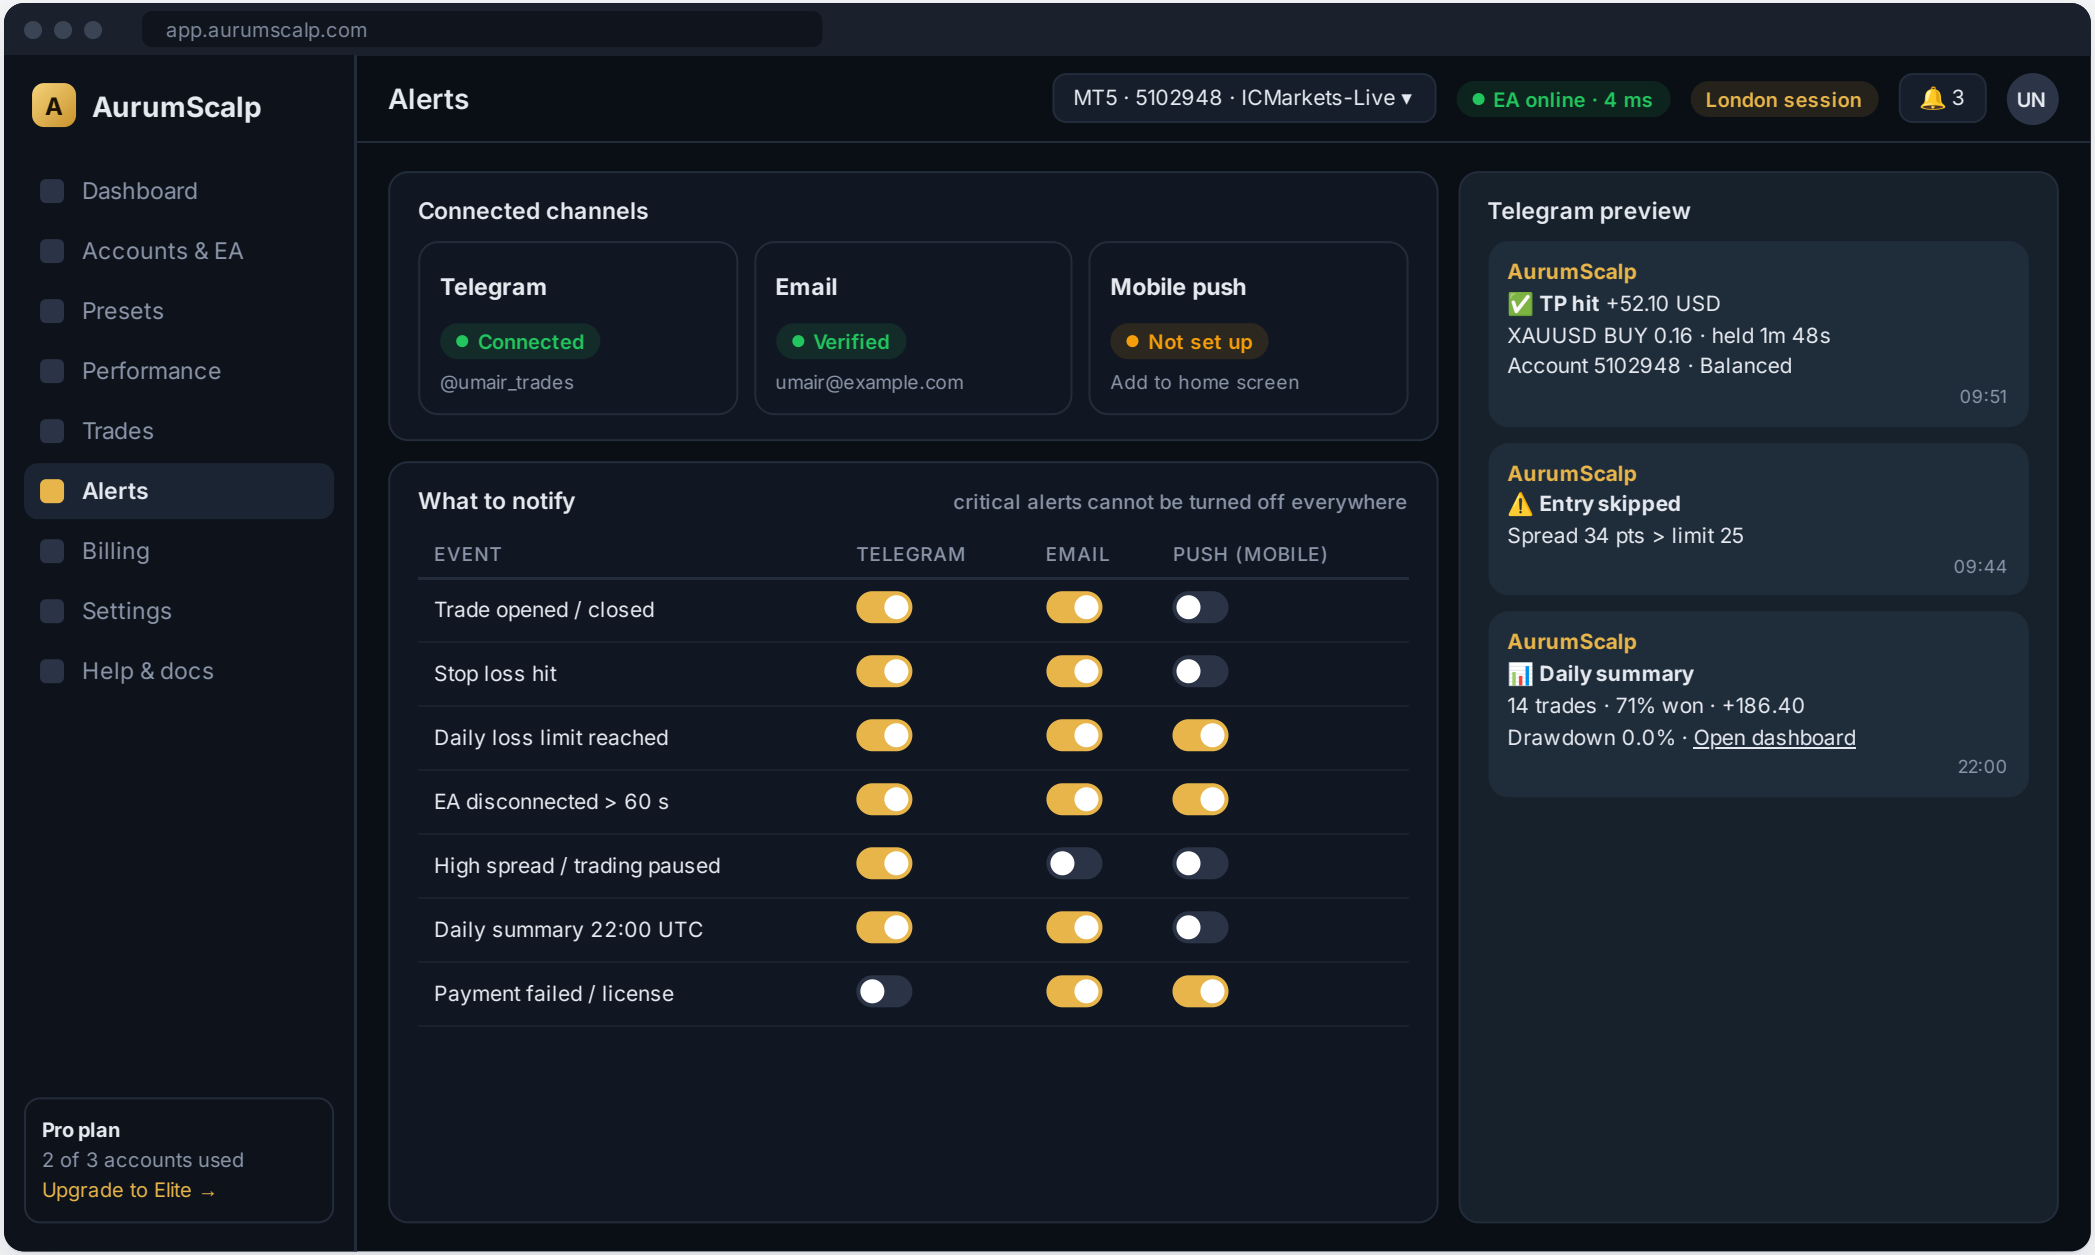

Fast filtering
Filters as chips, instant results, state kept in the URL so a support agent can open the same view.

Row detail
Click a row: side panel with the M1 chart around the trade, the signal reason and every order event.

Export
CSV for tax and journals; always the broker-reconciled numbers, not EA estimates.

Alerts & notifications

Where customers choose what to hear about, and how

Connect Telegram in one tap

'Connect' opens t.me/AurumScalpBot?start=<token>; the bot links the chat to the account.

Critical stays on

Disconnects and loss-limit hits must stay on in at least one channel; UI prevents turning all off.

Actionable messages

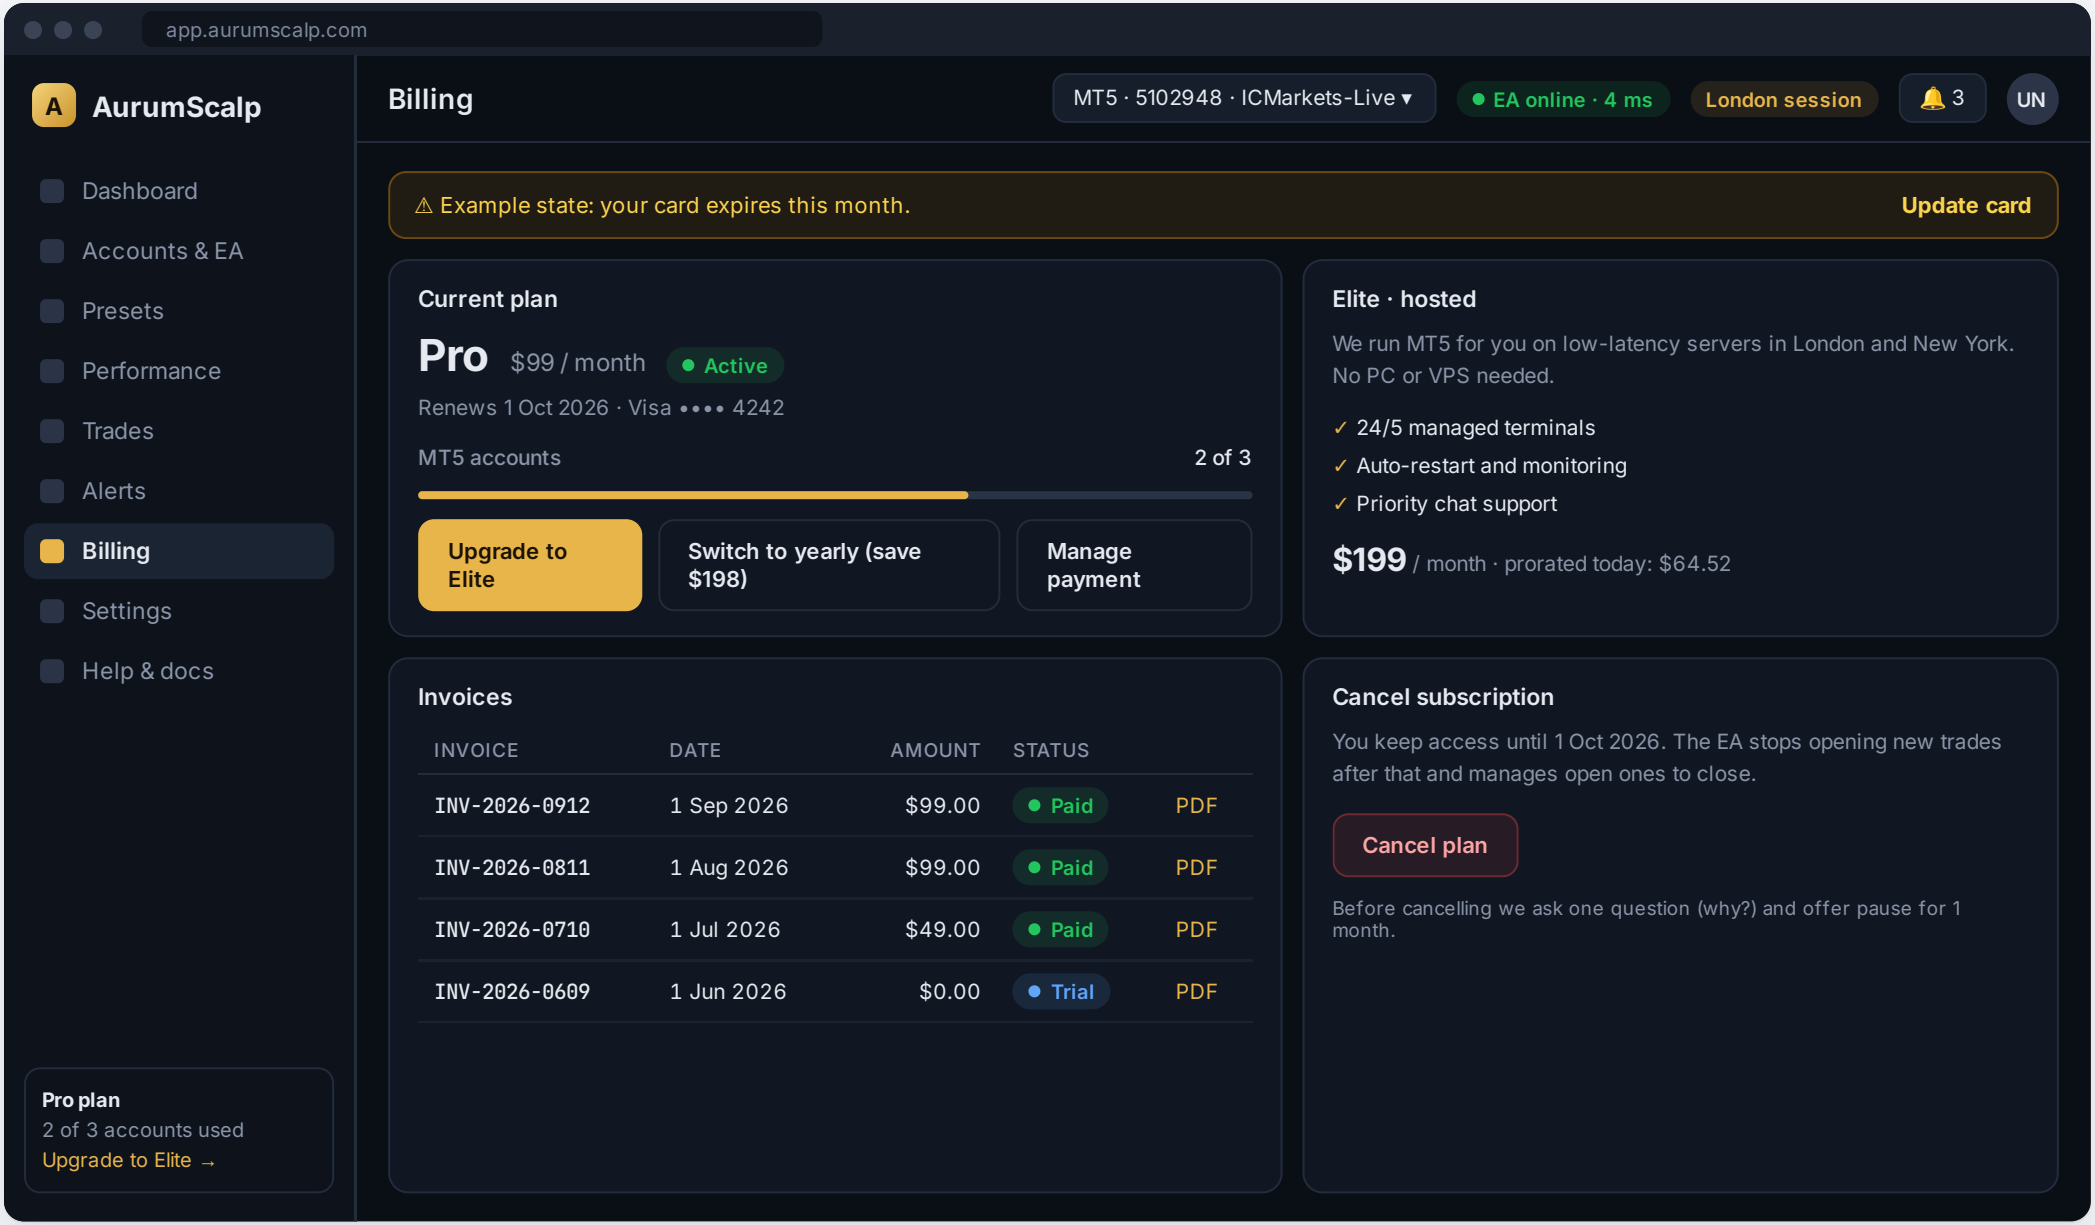

Every alert names the account and links to the exact trade or setting.

No spam

Trade alerts can be batched per 5 minutes on busy days; daily summary is the default.

Billing & subscription

Plan, usage, upgrade, invoices and cancellation

Usage drives upgrades

Account slots bar (2 of 3) and hosted benefits shown next to each other; upgrade shows the prorated amount.

Dunning UX

Failed payment: banner in app + emails for 72 h grace; EA keeps managing open trades but opens none after suspension.

Fair cancellation

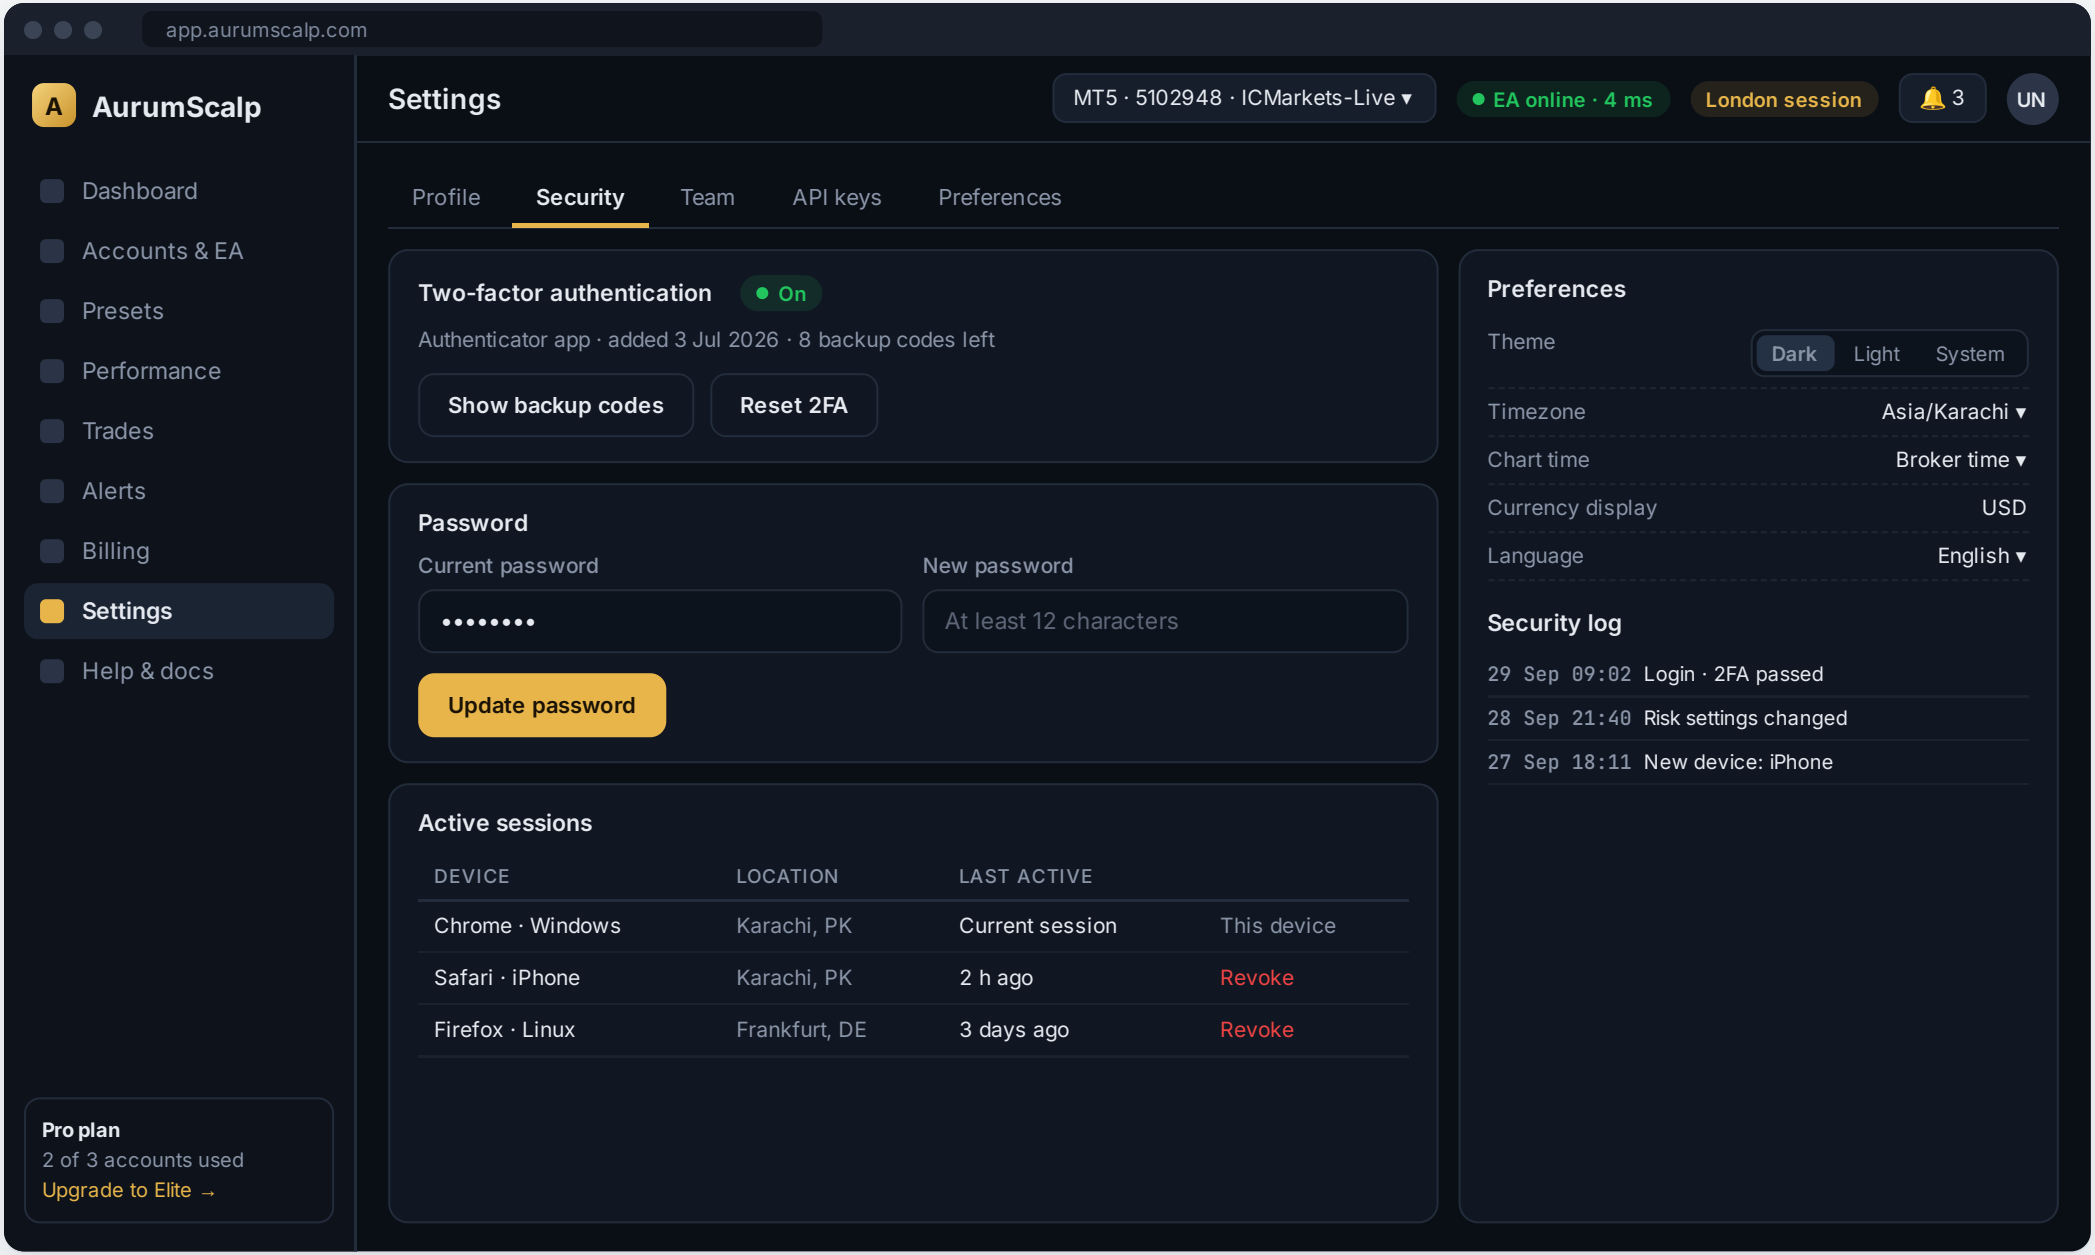

One-click cancel with a single reason question and a pause offer; no dark patterns (they cause chargebacks).

Provider portal

Card changes open the billing provider's portal; invoices are pulled from it.

Settings & security

Account protection customers can see and control

Visible security

2FA status, sessions and a security log build trust in a product that touches trading accounts.

Revoke anywhere

Revoke kills the refresh token instantly; 'Sign out all' after a password change.

Time zones

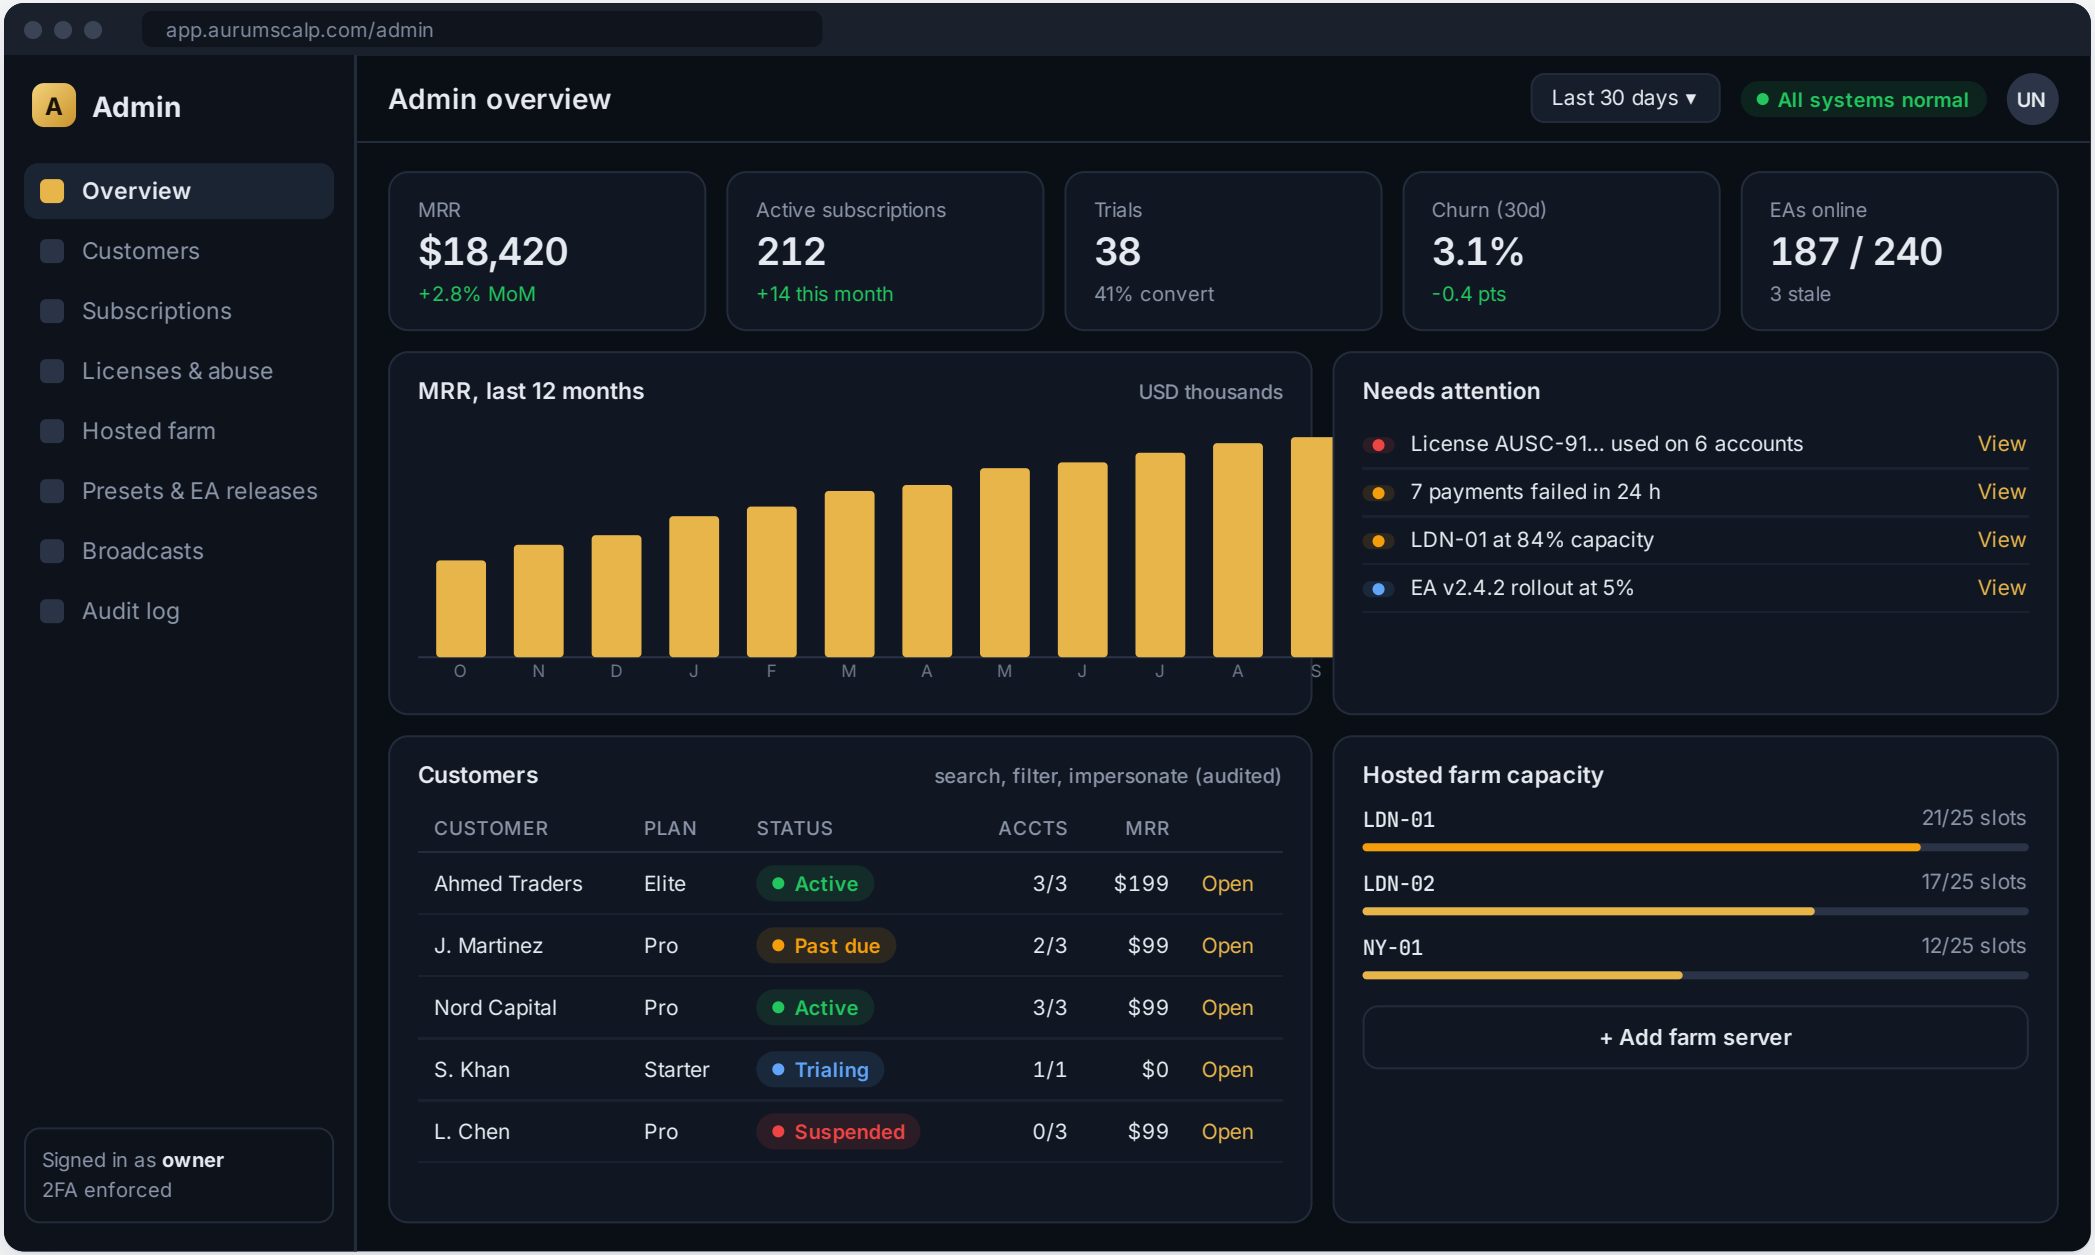

Users pick local or broker time for charts; all data stored in UTC.

Team (Pro+)

Invite a member as viewer or operator; only owners can change billing or risk limits.

Admin console

Your view of the business: revenue, customers, abuse and infrastructure

Business first

MRR, subscriptions, trials, churn and EAs online are the five numbers you check every morning.

Needs attention

A single queue for license abuse, failed payments, capacity and rollouts, each linking to its fix.

Impersonation

Support can view a customer's dashboard read-only; every session is logged with reason.

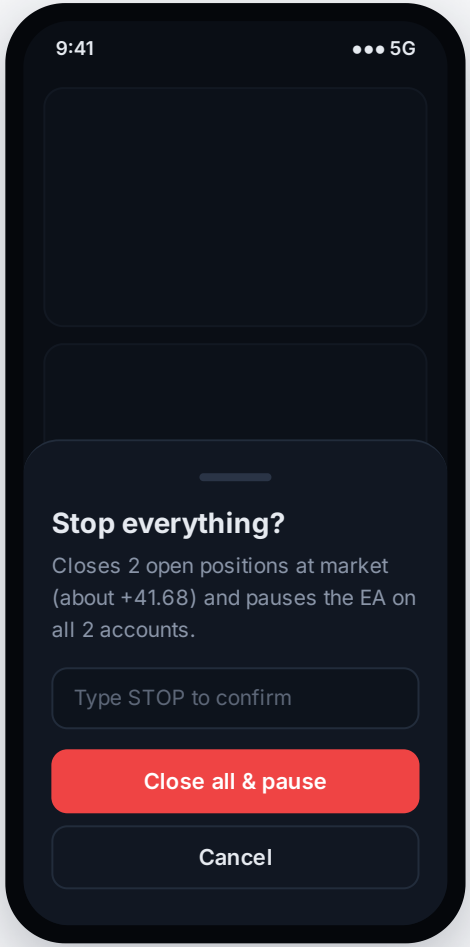

Releases

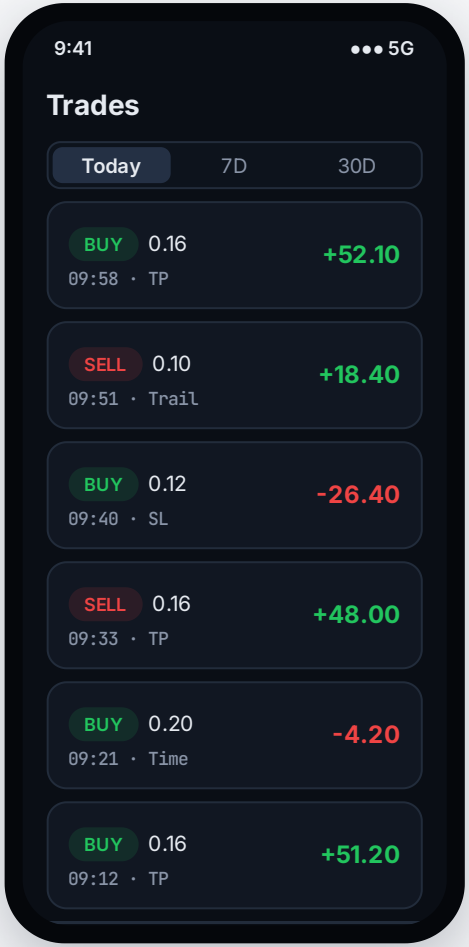

EA versions roll out by percentage with one-click rollback from the Presets & EA releases page.

Mobile views

Responsive web app (PWA): check, pause or stop from a phone

Mobile = monitor + stop

Phones get status, P&L, trades and the kill switch. Deep settings stay on desktop.

Bottom sheet confirm

Kill switch opens a sheet that states exactly what will happen, and needs 'STOP' typed to avoid pocket taps.

PWA

Add to home screen gives an app icon and push notifications without an app store.

Thumb zone

Primary actions sit in the bottom third; tap targets at least 44 px.

States, modals & feedback

What the app shows when nothing, something slow, or something wrong happens

app.aurumscalp.com · states

Empty state · no account yet

+

Connect your first MT5 account

Takes about 5 minutes. You'll need MT5 installed and your login number.

Start setup

Loading · skeletons

Skeletons match final layout; never a blank page or spinner-only screen.

Kill switch confirm (desktop)

⚠ Stop all trading?

This closes **2 positions** at market and pauses the EA on **2 accounts**. Resume manually later.

Cancel | Close all & pause

System banners

- EA disconnected 2m 14s · no new trades — Fix
- Payment failed · 2 days of grace left — Update
- US CPI at 12:30 UTC · trading paused ±30 min

Toasts

Settings applied
EA confirmed Balanced v3 at 10:02:14

Pending
Waiting for EA heartbeat...

Couldn't save
Risk per trade above plan limit (3%)

Error page · data stale

Equity

12,480.35

Stale — Last update 14 s ago · reconnecting...

Numbers dim and a stale badge appears so nobody acts on old prices.

Every screen has 4 states

Empty, loading, error and success are designed up front, not left to developers.

Danger is explicit

Destructive actions name the exact effect (how many positions, which accounts) before confirming.

Stale data is visible

If the socket drops, numbers dim with a timestamp, never silently freeze.

Toasts confirm server truth

Only the EA's confirmation turns a setting 'Applied'; the UI never pretends.

Handoff checklist

What developers and designers need to ship these screens

BUILD STACK

- ☐ Next.js App Router + TypeScript + Tailwind
- ☐ shadcn/ui for base components, themed with these tokens
- ☐ TradingView Lightweight Charts for price charts
- ☐ Recharts or visx for analytics charts
- ☐ TanStack Query for REST, one WebSocket client for live channels
- ☐ PWA manifest + web push for mobile
- ☐ i18n-ready strings (English first)

ACCESSIBILITY & QUALITY

- ☐ Text contrast 4.5:1 on dark surfaces (checked for muted text)
- ☐ Colour never the only signal: words/icons on every status
- ☐ Full keyboard navigation; visible gold focus ring
- ☐ Reduced-motion respected; no flashing price colours
- ☐ Tabular digits for all numbers
- ☐ Tap targets 44 px on mobile
- ☐ Every screen designed for empty, loading, error states

METRICS TO INSTRUMENT

- ☐ Visitor → trial conversion (pricing page)
- ☐ Trial → paid conversion
- ☐ Time from checkout to first EA handshake
- ☐ Weekly active dashboards per customer
- ☐ Kill-switch and pause usage
- ☐ Support tickets per 100 customers
- ☐ Churn reasons from the cancel flow

Next step 1

Recreate these screens in Figma using the tokens on page 02, then prototype the onboarding flow.

Next step 2

Build the design system as React components first; every screen reuses them.

Next step 3

Ship Login, Onboarding and Dashboard for the private beta; the rest follow.

Brand

'AurumScalp' is a placeholder. Swap the name and the gold accent once branding is final.
